Bikaner Technical University, Bikaner
March, 2026

CHARTERED INSTITUTE OF TECHNOLOGY ABU ROAD
SESSION 2023-2027

CERTIFICATE

This is to be certified that **Ms. Nandani, Ms. Sipahi Alvira and Ms. Saloni Agarwal**,
A student of 3rd Year B. Tech, 6th sem. of Computer Science & Engineering department
they presented their project Report. They have submitted their project report “**A
BAKERY PRODUCTS**” In partial fulfilment For the Award of The Degree of
Bachelor of Technology from **CHARTERED INSTITUTE OF TECHNOLOGY**,
BIKANER TECHNICAL UNIVERSITY, BIKANER.

Ms. Heena Baano
Project In Charge

Date: - 25/03/2026

HOD
Computer Science & Engineering Department
Chartered Institute of Technology

Principal
Chartered Institute of Technology
Abu Road, Rajasthan

DECLARATION

In accordance with the requirements for the degree of Bachelor of Technology in Computer Science & Engineering, in Faculty of Engineering & Technology, we present this Project report Entitled “A Bakery Products”. This report is completed under the Supervision of Ms. Heena Baano.

We declare that the work presented in the report is our own work except as acknowledged in the text and footnotes, and that to our knowledge this material has not been submitted either in whole or in part, for a degree at this University or at any other such Institution.

Date: - 25/03/2026

Nandani
23ECACS027

Sipahi Alvira
23ECACS030

Saloni Agarwal
23ECACS045

ACKNOWLEDGEMENT

The completion of our interdisciplinary project and project report depends upon the cooperation, coordination, and combined efforts of several sources of knowledge. We are grateful to Ms. Heena Baano for her ever willingness to give us valuable advice and direction. Whenever We approached her with a problem. We are thankful to her for providing immense guidance for this project.

We are also thankful to Mr. Govind Singh, Prof. & Head, Department of Computer Science & Engineering and all the staff members for their immense cooperation and motivation of completing our project.

Nandani
23ECACS027

Sipahi Alvira
23ECACS030

Saloni Agarwal

ABSTRACT

Bakery products constitute a significant segment of the global food industry, encompassing a wide range of items such as bread, cakes, pastries, and biscuits. They are valued not only for their sensory appeal and convenience but also for their cultural and nutritional importance. Advances in baking technology, ingredient innovation, and packaging have expanded the diversity and shelf life of these products, while consumer demand increasingly emphasizes health, sustainability, and functional benefits. This paper explores the evolution of bakery products, their role in daily diets and social traditions, and the emerging trends that shape their future in a competitive marketplace.

CONCLUSION

REFERENCE

INTRODUCTION

1.1 Overview of Bakery Project:

The bakery industry is one of the fastest-growing segments in the food sector, offering a wide range of products such as bread, cakes, pastries, cookies, and other baked goods. With changing lifestyles and increasing demand for convenient and ready-to-eat food, bakeries have become an essential part of daily life. From small local shops to large commercial outlets, bakeries serve customers of all age groups and preferences.

The main aim of this project is to develop a bakery business model along with a digital platform that allows customers to explore products and place orders easily. In today's digital era, integrating technology with traditional businesses is important for growth and customer satisfaction. Therefore, this project focuses not only on the bakery products but also on building an online system for ordering and management.

This project is designed to provide practical knowledge about how a bakery business operates, including product selection, pricing, marketing strategies, and customer handling. It also highlights the use of web technologies such as HTML, CSS, and JavaScript to create an interactive and user-friendly interface for customers.

The scope of this project includes understanding market demand, designing a system for online ordering, and analyzing the financial and operational aspects of running a bakery. This project will help in gaining both technical and business knowledge, making it useful for real-world applications.

The objectives of this project are:

- To understand the working of a bakery business
- To design and develop a bakery website
- To provide an easy and efficient online ordering system
- To analyse the cost, profit, and marketing strategies

In conclusion, this project combines business concepts with technical implementation, providing a complete overview of how a modern bakery can operate successfully in both offline and online environments.

1.2 Background of the Project

Earlier, bakery businesses were completely dependent on offline operations. Customers had to visit the shop physically to check the availability of products and make purchases. This traditional method had several limitations, such as time consumption, limited reach, and lack of proper product display.

With the advancement of technology, businesses started adopting digital platforms to improve their services. E-commerce websites have made it possible for customers to shop from anywhere at any time. Inspired by this concept, the bakery project is designed to provide similar convenience to customers in the bakery domain.

The idea behind this project is to bridge the gap between traditional bakery systems and modern online services. It aims to provide a simple yet effective solution that can be easily implemented and used by both customers and business owners.

1.3 Objectives of the Project

The main objectives of this project are:

- To develop a user-friendly bakery website
- To provide an online platform for customers to explore and order products
- To implement basic functionalities such as product listing and add-to-cart
- To understand the working and management of a bakery business
- To improve technical skills in web development
- To design a system that enhances customer experience
- To analyse how technology can improve traditional business models

1.4 Scope of the Project

The scope of the Bakery Management System is focused on developing a simple and functional website that meets the basic needs of an online bakery. The system allows users to view products, select items, and manage their cart.

This project mainly covers front-end development and basic interactivity. However, it has a wide scope for future improvements. Some possible enhancements include:

- Integration of secure online payment systems
- User authentication (login and registration)
- Admin panel for managing products and orders
- Real-time order tracking system
- Integration with delivery services
- Mobile application development

The project can be further developed into a full-scale commercial application with additional features and advanced technologies.

1.5 Technologies (Languages) Used in the Project

The Bakery Management System is developed using fundamental web development technologies. These technologies are easy to learn, widely used, and suitable for building interactive web applications.

1.5.1 HTML (Hypertext Markup Language)

HTML is the basic structure of any website. It is used to create web pages and define their layout. In this project, HTML is used to design different sections such as the header, navigation bar, product listings, images, buttons, and footer. It helps in organizing content in a structured manner.

HTML uses tags and elements to define different parts of the webpage. It ensures that the content is displayed correctly in web browsers.

1.5.2 CSS (Cascading Style Sheets)

CSS is used to enhance the visual appearance of the website. It controls the layout, colors, fonts, spacing, and overall design of the web pages. In this project, CSS is used to create an attractive and professional-looking bakery website.

CSS also plays an important role in making the website responsive. A responsive website can adjust its layout according to different screen sizes, such as mobile phones, tablets, and desktops. This improves user experience and accessibility.

1.5.3 JavaScript

JavaScript is a programming language used to add dynamic and interactive features to the website. In this project, JavaScript is used to implement functionalities such as:

- Add-to-cart feature
- Button click actions

TECHNOLOGIES USED

2.1 Introduction

The development of the Bakery Management System requires the use of various web technologies that help in creating a functional, attractive, and user-friendly website. In this project, the main focus is on front-end development, which involves designing the structure, layout, and behaviour of the website that users interact with directly.

The primary technologies used in this project are HTML, CSS, and JavaScript. These technologies are considered the core building blocks of web development and are widely used to create modern websites and web applications. Each of these technologies has a specific role and contributes to different aspects of the system. HTML is used to define the structure and content of the website. CSS is used to design and style the web pages, making them visually appealing. JavaScript is used to add interactivity and dynamic behaviour, allowing the website to respond to user actions.

The proper use and integration of these technologies ensure that the bakery website is easy to use, visually attractive, and capable of performing required tasks such as displaying products and managing user interactions.

2.2 HTML (Hypertext Markup Language)

HTML, or Hypertext Markup Language, is the standard markup language used to create web pages. It is the backbone of any website and provides the basic structure on which all other technologies are applied.

In the Bakery Management System, HTML is used to design the layout of the website and organize its content. It helps in creating different sections of the webpage such as the header, navigation bar, product display area, and footer.

HTML uses tags and elements to define different parts of the webpage. These tags instruct the web browser on how to display the content. Some commonly used HTML tags in this project include `<html>`, `<head>`, `<body>`, `<div>`, `<img>`, `<h1>`, `<p>`, and `<button>`.

The role of HTML in this project includes:

- Creating the overall structure of the website

- Displaying bakery products such as cakes, pastries, cookies, and bread
- Adding images of products to make the website more attractive
- Creating headings and text descriptions for better understanding
- Designing buttons like “Add to Cart” for user interaction
- Organizing content into sections for better navigation

HTML ensures that the content is properly structured and easy to understand. It acts as the foundation on which CSS and JavaScript are applied.

One of the major advantages of HTML is its simplicity. It is easy to learn and implement, making it suitable for beginners. It is also supported by all modern web browsers, ensuring compatibility across different devices.

2.3 CSS (Cascading Style Sheets)

CSS, or Cascading Style Sheets, is used to style and design the web pages created using HTML. While HTML provides the structure, CSS is responsible for the visual appearance and layout of the website.

In the Bakery Management System, CSS is used to enhance the look and feel of the website. It helps in making the website more attractive, organized, and user-friendly.

The main functions of CSS in this project include:

- Adding colors and themes to match the bakery concept
- Styling text with different fonts, sizes, and styles
- Designing product cards to display items in an organized manner
- Styling buttons, navigation bars, and menus
- Controlling spacing, margins, and alignment of elements
- Creating layouts using techniques like flexbox or grid

CSS also plays an important role in making the website responsive. A responsive website adjusts its layout based on the screen size of the device being used. This ensures that the bakery website can be accessed easily on mobile phones, tablets, and desktops.

For example, with the help of CSS media queries, the layout of product items can change from a grid format on a desktop screen to a single-column layout on a mobile screen. This improves usability and user experience.

Another advantage of CSS is that it allows separation of content and design. This makes the code more organized and easier to maintain. Changes in design can be made without affecting the HTML structure.

Overall, CSS enhances the visual quality of the website and makes it more engaging for users.

2.4 JavaScript

JavaScript is a programming language used to add interactivity and dynamic behavior to web pages. It allows the website to respond to user actions such as clicks, inputs, and selections.

In the Bakery Management System, JavaScript is used to implement important functionalities that improve user experience and make the website more interactive.

The key roles of JavaScript in this project include:

- Implementing the “Add to Cart” feature
- Handling button clicks events
- Updating cart items dynamically without reloading the page
- Displaying alert messages or notifications
- Managing user interactions with the website

For example, when a user clicks on the “Add to Cart” button, JavaScript executes a function that adds the selected product to the cart. It may also update the number of items in the cart and display a confirmation message to the user.

JavaScript makes the website dynamic, meaning the content can change based on user actions without refreshing the page. This improves the performance and usability of the website.

Another important aspect of JavaScript is that it allows real-time interaction. Users can see immediate results of their actions, which enhances the overall experience.

Without JavaScript, the bakery website would be static and would not support features like cart management or dynamic updates.

2.5 Working of Technologies Together

In the Bakery Management System, HTML, CSS, and JavaScript work together to create a complete and functional web application. Each technology has a specific role, but they are interconnected and dependent on each other.

- HTML provides the basic structure of the webpage
- CSS enhances the design and layout
- JavaScript adds functionality and interactivity

The integration of these technologies can be understood through an example:

When a user visits the bakery website:

1. HTML displays the structure of the webpage, including product listings and buttons
2. CSS styles the webpage by adding colors, layouts, and designs
3. JavaScript enables interaction, such as adding products to the cart when a button is clicked

For instance, the “Add to Cart” button is created using HTML, styled using CSS, and made functional using JavaScript. When the user clicks the button, JavaScript processes the action and updates the cart.

This coordination between technologies ensures that the website is:

- Well-structured
- Visually appealing
- Interactive and user-friendly

The proper integration of HTML, CSS, and JavaScript is essential for developing modern web applications. It allows developers to create websites that are not only functional but also engaging and efficient.

SYSTEM OVERVIEW

3.1 Introduction

The system overview provides a complete understanding of how the Bakery Management System works and how it improves the traditional bakery business. This chapter explains the existing system, its limitations, and the proposed system developed in this project.

The Bakery Management System is designed as a web-based application that allows users to view bakery products and place orders online. It aims to provide a simple, efficient, and user-friendly platform for both customers and bakery owners.

3.2 Existing System

The existing system refers to the traditional method of running a bakery business. In this system, all operations are performed manually without the use of digital technology.

In a traditional bakery:

- Customers visit the shop physically
- They check available products manually
- Orders are placed directly at the counter
- Payments are made in cash
- Records are maintained manually

Although this system works for small businesses, it has several limitations in today's modern environment.

3.3 Limitations of Existing System

The traditional bakery system has many drawbacks, such as:

- Time-consuming: Customers need to visit the shop physically, which takes time
- Limited reach: Only nearby customers can access the bakery
- No online presence: Business cannot reach a larger audience
- Manual errors: High chances of mistakes in order handling
- Lack of product visibility: Customers cannot view all products easily
- Inconvenience: Customers cannot place orders from home

These limitations reduce efficiency and affect customer satisfaction.

3.4 Proposed System

The proposed system is a web-based Bakery Management System that overcomes the limitations of the traditional system. It provides an online platform where customers can easily browse products and place orders.

In this system:

- Customers can access the website from anywhere
- Products are displayed with images, names, and prices
- Users can add items to the cart
- Orders can be placed easily
- The system provides a smooth and user-friendly experience

The proposed system improves efficiency, saves time, and enhances customer satisfaction.

3.5 Features of the Proposed System

The Bakery Management System includes several useful features:

- Product Display: Shows bakery items like cakes, pastries, cookies
- Add to Cart: Users can select multiple products
- User-Friendly Interface: Easy to navigate and understand
- Responsive Design: Works on mobile, tablet, and desktop
- Fast Access: Quick loading and smooth performance

These features make the system simple and effective.

3.6 Working of the System

The working of the Bakery Management System can be explained step by step:

1. The user opens the bakery website
2. The homepage displays available products
3. The user selects a product
4. The user clicks on “Add to Cart”
5. The product is added to the cart using JavaScript
6. The user can view selected items in the cart
7. The user proceeds to place the order

This process is simple and requires minimal effort from the user.

3.7 Benefits of the Proposed System

The proposed system offers many benefits:

- Saves time for customers
- Provides convenience of online ordering
- Reduces manual work
- Improves business efficiency
- Increases customer reach
- Enhances user experience

It also helps bakery owners grow their business by reaching more customers.

3.8 Comparison Between Existing and Proposed System

Feature	Existing System	Proposed System
Mode	Offline	Online
Accessibility	Limited	Global
Time Efficiency	Low	High
User Convenience	Low	High
Error Handling	Manual	Reduced

This comparison clearly shows that the proposed system is more efficient and user-friendly.

SYSTEM REQUIREMENTS

4.1 Introduction

System requirements define the necessary resources needed for the successful development and operation of the Bakery Management System. These requirements include both hardware and software components that ensure the system functions properly and efficiently.

Understanding system requirements is important because it helps in identifying the tools and environment needed to develop, test, and run the project. It also ensures that the system performs smoothly without any technical issues.

The Bakery Management System is a web-based application, so it does not require very high-end hardware or complex software. It can be developed and executed using basic computer systems and commonly available tools.

4.2 Hardware Requirements

Hardware requirements refer to the physical components needed to develop and run the bakery project. Since this project is simple and based on web technologies, the hardware requirements are minimal.

The required hardware components are:

- **Computer/Laptop:** A basic computer system or laptop is required to develop and run the project. The system should have a minimum of 4 GB RAM and a standard processor for smooth performance.
- **Processor:** A processor such as Intel i3 or above is sufficient to handle the development tasks and run the website efficiently.
- **Memory (RAM):** At least 4 GB RAM is required to run the code editor, browser, and other tools without lag.
- **Storage:** A minimum of 500 MB free storage is needed to store project files, images, and code.
- **Input Devices:** Keyboard and mouse are required for coding and navigation.
- **Internet Connection:** An internet connection is necessary for testing the website, downloading resources, and accessing online tools.

These hardware requirements are basic and easily available, making the project accessible for students.

4.3 Software Requirements

Software requirements include the programs and tools needed to develop and run the system. These tools help in writing code, designing the interface, and testing the application.

The main software requirements for this project are:

- **Operating System:** The project can be developed on any operating system such as Windows, macOS, or Linux.
- **Web Browser:** A web browser like Google Chrome, Microsoft Edge, or Mozilla Firefox is required to run and test the website. These browsers support HTML, CSS, and JavaScript.
- **Code Editor:** A code editor such as Visual Studio Code (VS Code) is used to write and manage the project files. It provides features like syntax highlighting, auto-completion, and debugging support.
- **Technologies Used:**
 - HTML for structure
 - CSS for styling
 - JavaScript for functionality
- **Optional Tools:**
 - Bootstrap for responsive design
 - Browser developer tools for debugging

These software tools are easy to use and widely available, making the development process simple and efficient.

4.4 Functional Requirements

Functional requirements describe the main features and operations that the system must perform. These requirements define what the system should do.

The functional requirements of the Bakery Management System include:

- The system should display bakery products such as cakes, pastries, and cookies
- The system should allow users to view product details like name, image, and price
- The system should provide an “Add to Cart” feature
- The system should allow users to select multiple products

- The system should update cart items dynamically
- The system should provide a simple and easy navigation system
- The system should respond to user actions such as button clicks

These requirements ensure that the system performs its basic functions effectively.

4.5 Non-Functional Requirements

Non-functional requirements define the quality and performance aspects of the system. These requirements focus on how the system performs rather than what it does.

The non-functional requirements of the project include:

- Performance: The website should load quickly and respond to user actions without delay.
- Usability: The system should be easy to use and understand for all users.
- Reliability: The system should work properly without errors or crashes.
- Responsiveness: The website should adapt to different screen sizes such as mobile, tablet, and desktop.
- Maintainability: The code should be simple and well-structured so that it can be easily modified in the future.
- Compatibility: The system should work on different web browsers.

These requirements improve the overall quality and user experience of the system.

4.6 User Requirements

User requirements describe what users expect from the system. These requirements are based on user needs and preferences.

For the Bakery Management System, user requirements include:

- Easy access to bakery products
- Clear display of product details
- Simple navigation between pages
- Quick and easy ordering process
- Attractive and clean design
- Fast response to user actions

Meeting these requirements ensures customer satisfaction and usability.

CODE IMPLEMENTATION

5.1 Project Structure:

The project is organized into different files and folders for better management and clarity. The following screenshot shows the structure of the project including HTML, CSS, and JavaScript files.

5.2 HTML Code Implementation

HTML is used to create the basic structure of the website. The following screenshots show the HTML code used for designing different sections such as the homepage, product display, and navigation bar.

5.2.1 index.html

```
body>
<nav id="navbar">

<div id="bakery">
  
</div>

<ul>
  <li class="item"><a href="#">Home</a></li>
  <li class="item"><a href="#">Services</a></li>
  <li class="item"><a href="#">About Us</a></li>
  <li class="item"><a href="#">Contact Us</a></li>
</ul>
</nav>

<section id="home">
  <h1 class="h-primary">Welcome to my Online Meal</h1>
  <p>Our bakery is dedicated to creating fresh, delicious, and high-quality baked goods that bring joy to ever
  <p>We make every moment special, whether it is a celebration or a simple daily delight. 🍰👤</p>
  <button class="btn">Order Now</button>
</section>

<section class="services-container">
  <h1 class="h-primary center">Our Services</h1>
  <div id="services">
    <div class="box">
      
      <h2 class="h-secondary center">Food Catering</h2>
      <p class="center"> Delicious bakery catering for birthdays, weddings, and special events.
```

```
h1 class="title">Our Products</h1>

div class="container">

  <div class="card">
    
    <h3>CAKES</h3>
    <button class="add-to-cart" data-name="cakes">Add to Cart</button>
  </div>

  <div class="card">
    
    <h3>BROWNIES</h3>
    <button class="add-to-cart" data-name="brownies">Add to Cart</button>
  </div>

  <div class="card">
    
    <h3>CUPCAKES</h3>
    <button class="add-to-cart" data-name="cupcakes">Add to Cart</button>
  </div>

  <div class="card">
    
    <h3>PASTRIES</h3>
    <button class="add-to-cart" data-name="pastries">Add to Cart</button>
  </div>
```

```

<!-- CART -->
<div id="cart">
  <h2>🍰 Cart</h2>
  <ul id="cart-items"></ul>
</div>

<!--to style features -->
  <div class="features">

    <div class="feature-box">
      <h2>Crafted by Expert Bakers</h2>
      <p>Our experienced bakers combine traditional techniques with modern creativity
      | to create delicious taste every occasion.
      </p>
    </div>

    <div class="feature-box">
      <h2>Made with Premium Quality</h2>
      <p>We carefully select the finest ingredients to maintain the quality and flavour that our
      | customers love.
      </p>
    </div>

    <div class="feature-box">
      <h2>Perfect for every Celebration</h2>
      <p>Whether it is a Birthday, anniversary, or special events, our bakery products add

```

5.3 CSS Code Implementation

CSS is used to enhance the appearance and layout of the website. The following screenshots represent the styling code used to design the interface, colors, and responsiveness of the bakery website.

5.3.1 style.css

```
style.css X index.html JS script.js
> # style.css > ...
1  /* CSS Reset */
2  *{
3      margin: 0;
4      padding: 0;
5  }
6
7  /*CSS Variables*/
8  :root{
9      --navbar-height:59px;
10 }
11
12 /* Navigation bar*/
13 #navbar{
14     display: flex;
15     align-items: center;
16     background-color: rgb(58, 56, 56);
17     position: relative;
18     /* text-decoration: none; */
19 }
20
21 /* Nnavigation bar : bakery and image */
22 #bakery{
23     margin: 10px 34px;
24 }
25 #bakery img{
26     height: 50px;
27     width: 50px;
28     margin: 3px 6px;
29     border-radius: 50%;
30 }
31 /* Navigation bar : list styling*/
32 #navbar ul{
33     display: flex;
```

```

/* Home section*/
#home{
    display:flex ;
    flex-direction: column;
    padding: 3px 200px;
    justify-content: center;
    height:445px;
    align-items: center;
}

#home::before{
    content: "";
    position: absolute;
    background-image:url('image.png');
    background-size: cover;
    height:68%;
    width:100%;
    z-index: -1;
    opacity: 0.6;
}

#home h1{
    color:□ #5E0006;
    text-align: center;
    font-family: "Inter", sans-serif;
}

#home p{
    color:□ black;
    text-align: center;
    font-size: 18px;
}

```

```

/*services section*/
#services{
    margin: 34px;
    display: flex;
}

#services .box{
    border: 2px solid black;
    height: 246px;
    width:50%;
    margin-top: 10px;
    padding: 34px;
    margin:3px 6px;
    border-radius: 28px;
    background: #f6e9e9;;
}

#services .box img{
    margin-left: 90px;
    height: 100px;
    width: 100px;
    border-radius: 50%;
    display: block;
}

#services .box p{
    font-family:"Inter", sans-serif;
}

```

```

/* NAVBAR */
#navbar {
    flex-direction: column;
    align-items: center;
}

#navbar ul {
    flex-direction: column;
    width: 100%;
    text-align: center;
}

#navbar ul li {
    margin: 8px 0;
}

/* HOME SECTION */
#home {
    padding: 20px;
    height: auto;
}

#home h1 {
    font-size: 24px;
}

#home p {
    font-size: 14px;
}

```

5.4 JavaScript Code Implementation

JavaScript is used to add interactivity to the website. The following screenshots show the code used for implementing features such as add-to-cart functionality and user interactions.

5.4.1 script.js

```
script.js > displayCart
1  let cart = [];
2
3  let buttons = document.querySelectorAll(".add-to-cart");
4  let cartList = document.getElementById("cart-items");
5
6  buttons.forEach(button => {
7    button.addEventListener("click", () => {
8      let itemName = button.getAttribute("data-name");
9
10     cart.push(itemName);
11     displayCart();
12   });
13 });
14
15 function displayCart() {
16   cartList.innerHTML = "";
17
18   cart.forEach(item => {
19     let li = document.createElement("li");
20     li.textContent = item;
21     cartList.appendChild(li);
22   });
23 }

ADVANTAGES AND LIMITATIONS

6.1 Introduction

The Bakery Management System is designed to provide a simple and efficient way of managing a bakery through an online platform. Like any system, it has both advantages and limitations. Understanding these aspects is important to evaluate the performance of the system and identify areas for improvement.

This chapter discusses the various benefits provided by the system as well as the limitations that may affect its performance. It also helps in understanding how the system can be improved in the future.

6.2 Advantages of the System

The Bakery Management System offers several advantages for both customers and bakery owners. These advantages make the system efficient, user-friendly, and suitable for modern needs.

6.2.1 Time Saving

One of the major advantages of the system is that it saves time for users. Customers do not need to visit the bakery physically. They can browse products and place orders online from their homes. This reduces the time required for purchasing bakery items.

6.2.2 Easy Accessibility

The system can be accessed from anywhere using a device with an internet connection. This makes it convenient for users to explore bakery products at any time. It removes the limitation of location and allows the bakery to reach more customers.

6.2.3 User-Friendly Interface

The website is designed in a simple and easy-to-understand manner. Users can navigate through the website without any difficulty. Features like product display and add-to-cart are easy to use, which improves the overall user experience.

6.2.4 Attractive Design

With the help of CSS, the website has an attractive layout with proper colors, images, and design. This helps in grabbing the attention of users and makes the browsing experience enjoyable.

6.2.5 Efficient Product Display

All bakery products are displayed in an organized way with images, names, and prices. This helps customers to easily select products without confusion.

6.2.6 Reduced Manual Work

The system reduces the need for manual work in managing orders. Customers can directly place orders through the website, which minimizes human effort and reduces errors.

6.2.7 Cost Effective

The system does not require expensive tools or software. It is developed using basic web technologies like HTML, CSS, and JavaScript, which are freely available. This makes it cost-effective for small businesses and students.

6.2.8 Responsive Design

The website can be accessed on different devices such as mobile phones, tablets, and desktops. This flexibility improves usability and makes the system more effective.

6.3 Limitations of the System

Despite its advantages, the Bakery Management System has certain limitations. These limitations highlight the areas where improvements can be made.

6.3.1 No Online Payment System

The system does not include an online payment feature. Customers cannot make payments through the website, which limits its functionality.

6.3.2 No User Authentication

There is no login or registration system in the project. This means user data is not stored, and personalized services cannot be provided.

6.3.3 Limited to Front-End Development

The project mainly focuses on front-end technologies. It does not include backend development or database integration, which limits data storage and processing capabilities.

6.3.4 No Order Tracking System

Customers cannot track their orders after placing them. This reduces the transparency of the system and may affect user satisfaction.

6.3.5 Limited Security Features

Since the project does not include advanced security measures, it may not be suitable for handling sensitive data in real-world applications.

6.3.6 Dependence on Internet Connection

The system requires an internet connection to function. Without internet access, users cannot use the website.

FUTURE SCOPE

7.1 Introduction

The Bakery Management System developed in this project provides a basic platform for displaying bakery products and allowing users to place orders online. However, with the advancement of technology and increasing user expectations, there are many opportunities to enhance and expand the system in the future.

Future scope refers to the improvements and additional features that can be added to the system to make it more efficient, secure, and suitable for real-world applications. This chapter discusses various enhancements that can be implemented to upgrade the current system.

7.2 Integration of Online Payment System

One of the most important improvements in the future is the integration of an online payment system. Currently, the project does not support online transactions.

In future versions, payment gateways such as debit/credit cards, UPI, and net banking can be added. This will allow customers to complete their purchases online without any manual payment process. It will also make the system more professional and suitable for real business use.

7.3 User Authentication System

The current system does not include a login or registration feature. In the future, a user authentication system can be implemented.

This will allow users to:

- Create accounts
- Log in securely
- Save personal details
- View order history

This feature will improve user experience and provide personalized services.

7.4 Database Integration

At present, the system does not store data permanently. In the future, a database can be integrated to store important information such as:

- User details
- Product information
- Order records
- Transaction history

Using databases like MySQL or MongoDB will make the system more efficient and capable of handling large amounts of data.

7.5 Admin Panel Development

An admin panel can be added in future to allow the bakery owner to manage the system easily.

Through the admin panel, the owner can:

- Add, update, or delete products
- Manage customer orders
- View sales reports
- Monitor system activities

This will make the system more organized and easier to control.

7.6 Order Tracking System

Currently, users cannot track their orders. In future versions, an order tracking system can be introduced.

This feature will allow customers to:

- Check order status
- Track delivery progress
- Receive updates about their orders

This will improve transparency and customer satisfaction.

7.7 Mobile Application Development

With the increasing use of smartphones, developing a mobile application for the bakery system can be a great improvement.

A mobile app will:

- Provide better user experience

- Allow faster access
- Increase customer engagement

This will make the system more accessible and convenient for users.

7.8 Integration with Delivery Services

The system can be enhanced by integrating delivery services. This will allow customers to receive their orders at home.

Features can include:

- Delivery scheduling
- Address management
- Delivery tracking

This will make the bakery system more practical and useful in real-world scenarios.

CONCLUSION

The Bakery Management System developed in this project provides a simple and effective solution for managing a bakery business using a web-based platform. The main objective of this project was to design and develop a user-friendly website that allows customers to view bakery products and place orders easily.

Through this project, various web development technologies such as HTML, CSS, and JavaScript have been successfully used to create an interactive and responsive website. The system includes important features like product display, add-to-cart functionality, and simple navigation, which enhance the overall user experience.

This project also helped in understanding how traditional business systems can be improved using digital technology. By converting a manual bakery system into an online platform, the project demonstrates the importance of modern web solutions in improving efficiency, saving time, and increasing accessibility.

Although the system has some limitations, such as lack of backend integration and online payment features, it provides a strong foundation for further development. Future enhancements can make the system more advanced and suitable for real-world applications.

From a learning perspective, this project has provided valuable practical knowledge of web development and system design. It has improved technical skills, problem-solving abilities, and understanding of how different technologies work together to build a complete system.

In conclusion, the Bakery Management System is a successful implementation of a basic web application that meets its objectives and provides a clear understanding of developing a real-world project. It also opens opportunities for further improvements and innovation in the future.
